A4

[0005] An organic electroluminescent device according to the present invention comprises an organic thin-film transistor element including at least an active layer made from an organic-material, and an organic electroluminescent element driven by the organic thin-film transistor. As the organic thin-film transistor is adopted for driving the organic electroluminescent element, the entire manufacturing operation may be performed by inkjet processes without using special equipment. Accordingly, the manufacturing cost can be reduced.

A5

[0012] In short, according to the configuration in which the organic thin-film transistor is adopted for driving the organic electroluminescent element, the organic electroluminescent device may be manufactured by the liquid-phase processes such as an inkjet process without using special devices or equipment.

Please delete paragraphs **[0045]** to **[0063]**.

A6

[0100] With reference to the description above, the present invention may have the following forms.

(1) An organic electroluminescent device according to any of the above embodiments, further comprising interlayer wiring that electrically connects the organic thin-film transistor element with the organic electroluminescent element.

(2) A method of manufacturing an electroluminescent device according to any of the above methods, further comprising a step of providing interlayer wiring that electrically connects the organic thin-film transistor element with the organic electroluminescent element.
